On December 18, 2003, the United States Centers for Disease Control and Prevention (CDC) published updated guidelines for infection control in dental health-care settings in the Morbidity and Mortality Weekly Report. These guidelines culminate over two years of work by CDC experts in infection control to revise and update recommendations that were first published in 1986 and revised in 1995. In addition to updating topics addressed in earlier guidelines, the new recommendations synthesize guidance from other CDC publications on a wide range of relevant topics. While compliance with these federal guidelines is voluntary, dentists in the US regard them as standard. Some states even adopt them as a legal standard among the laws pertaining to running a dental practice.

Infection control has been at the forefront of our minds, especially over the past year given the occurrence of SARS and the bird flu. Although the guidelines discussed in this article are voluntary, dentists in the US regard them as standard. Some states even adopt them as a legal standard among the laws pertaining to running a dental practice.

Updated Dental Infection Control Guidelines for Dentists

Shannon Mills, U.S.A.
